
Swift Energy 'Frac's' Two New Kauri Wells

Swift Energy New Zealand Ltd reports that it has successfully completed its Kauri-E2 well into the Kauri Sandstone of its PEP 38719 permit.

Both the Kauri-E2 and the previously drilled Kauri-E1 well have been successfully fracture stimulated and are beginning to flow hydrocarbons to the Rimu Production Station. Swift Energy says that following the initial well bore clean up and stabilisation of flowing pressures, long-term production rates will be established. Operations are also underway to fracture stimulate the Rimu-A1 well in PMP 38151 to enhance production from the Tariki Sandstone. ■
