

PGS Awarded Woodside Seismic Contract

PGS Australia has received a contract to provide data processing services for all of Woodside's global marine data processing controlled from Australia. The contract has an initial term of two years with the option to extend to four years.

PGS Group President Data Processing and Technology, Sverre Strandenes, said Woodside will use software developed by PGS, alongside a team from PGS in Woodside's office. He said the planned projects will be exploiting the latest processing technologies including 4D, 3D-SRME, multi-azimuth surveys, and depth imaging.

"The award of this tender represents a significant milestone for DP in Asia Pacific", he said. "Woodside is a key client for us and together with them we will use new, advanced processing tools to provide a clearer image."

PGS Vice President Data Processing for Asia, Jo McArdle, said Woodside constructed a masterpiece tender document and procurement procedure to perform a thorough evaluation of the technical and commercial capabilities of all the major contractors.

"It is a testament to the strength and capabilities of our people and our technology to receive this award and we intend to excel throughout our partnership with Woodside", McArdle said. ■
