Maps and Sections of Petroleum Geology of Continental Shelf of China

The distribution of the sedimentary basins of the continental shelf of China and the geology of adjacent regions will be presented in map displays. Other maps will exhibit the major structures and formations of pre-Tertiary basement rocks. Accompanying these displays are three sedimentary facies maps for the Bohai Bay, East China Sea, and South China Sea basins. Examples of offshore oil and gas traps, of which there are more than 10 types, will be exhibited. Some of these traps are not known in the east mainland of China. Seismic sections revealing the subsurface stratigraphy and structures of Bohai Bay, South Yellow Sea, East China Sea, Pearl River Mouth, Ying Ge Hai, Beibu Bay, and other regions will augment the map displays.
