

Indo-Pacific To Drill Kahili-1 Deviation

Indo-Pacific Energy Ltd intends to drill a deviated well in PEP 38736 onshore Taranaki to test a higher section of the structure identified by the Kahili-1 well, drilled earlier this year.

Kahili-1 found a small amount of oil with drilling mud from the Tariki sand below 2890 m with a downhole sampler.

The Kahili-1A deviated well will be drilled as soon as suitable funding arrangements are settled.

The Century rig will be available to perform the drilling after June.
