EARLY HISTORY OF THE CADDOS-PINE ISLAND FIELD, CADDOS PARISH, LOUISIANA

C. Lane Sartor, Sartor-Richardson, Inc., Shreveport, Louisiana 71101

The Caddo-Pine Island Field, located principally in Caddo Parish, Louisiana, was the first of the very large oil and gas fields discovered in Louisiana. From its discovery in 1905 to the present it has had considerable influence both on the petroleum industry and the general economy of Northwest Louisiana.

The geologic feature responsible for this petroleum accumulation is a large, low relief, closed anticlinal structure which occupies the crest of the Sabine Uplift, the dominant feature between the East Texas Salt Dome Basin on the west and the North Louisiana Interior Salt Dome Basin on the east.

The majority of the production has been from reservoirs within the Upper Cretaceous together with those Lower Cretaceous zones which occur unconformably below the Upper and Lower Cretaceous contact. Other Lower Cretaceous zones have produced, but in relatively minor total quantities.

Throughout the ninety-seven year history of the field total production has risen and declined only to be revived by deeper drilling, the development of new production techniques, and field extension drilling.

Now in its latter stages of depletion, most of this historic field's producing wells are being operated by local independents. Their future is tied to the price of crude oil as they await new techniques capable of unlocking the millions of barrels of oil still in place in the Upper Cretaceous Annona Chalk.

THE WELL AT WICHITA

Lawrence H. Skelton, Kansas Geological Survey, 4150 Monroe St., Wichita, Kansas 67209

At the turn of the 20th century, municipalities in eastern Kansas were beginning to thrive because of large, recently discovered, natural gas reserves. Such discoveries and commensurate development attracted industries, capital and population from out of state. Understandably, those cities were envied by towns farther west. The Wichita Daily Eagle newspaper on March 7, 1896 noted that “If there is any one thing on earth that can prevent Wichita from becoming a great city, it is a lack of cheap fuel.” Exhibiting foresight to avoid such failure, in 1894 the Wichita city council authorized a municipal bond issue of $10,000.00 to drill an exploratory well on city property in search of economic deposits of coal, gas, salt or oil. Such well was spudded on October 19, 1895 in what now is downtown Wichita. From then until April 30, 1897, the city struggled with almost every imaginable problem before giving up the effort. There is a notable lack of information about this well, as being only published newspaper accounts of the day and a brief mention in an 1898 issue of Transactions of the Kansas Academy of Science.
